

Paleolimnological assessment of nutrients and algae in the LOW:

Review of initiatives and update on research

Paleolimnological assessment of nutrients and algae in the LOW:

Review of initiatives

- Explore possibility of link between recent algal blooms & TP
 - Have TP concentrations increased in the last few decades?

Paleolimnological assessment of nutrients and algae in the LOW:

Review of initiatives

- Explore possibility of link between recent algal blooms & TP
 - Have TP concentrations increased in the last few decades?
- Survey of modern sedimentary diatom assemblages in LOW (ON)
 - Training set of LOW sites along TP gradient
 - Identify areas of elevated and low nutrient concentrations
 - Do diatoms track within-lake differences in env. conditions & water quality?
 - Development of diatom-based TP model

Paleolimnological assessment of nutrients and algae in the LOW:

Review of initiatives

- **Explore possibility of link between recent algal blooms & TP**
 - Have TP concentrations increased in the last few decades?
- **Survey of modern sedimentary diatom assemblages in LOW (ON)**
 - Training set of LOW sites along TP gradient
 - Identify areas of elevated and low nutrient concentrations
 - Do diatoms track within-lake differences in env. conditions & water quality?
 - Development of diatom-based TP model
- **Full core analyses – historical changes in lake water quality**

Paleolimnological assessment of nutrients and algae in the LOW:

Review of initiatives

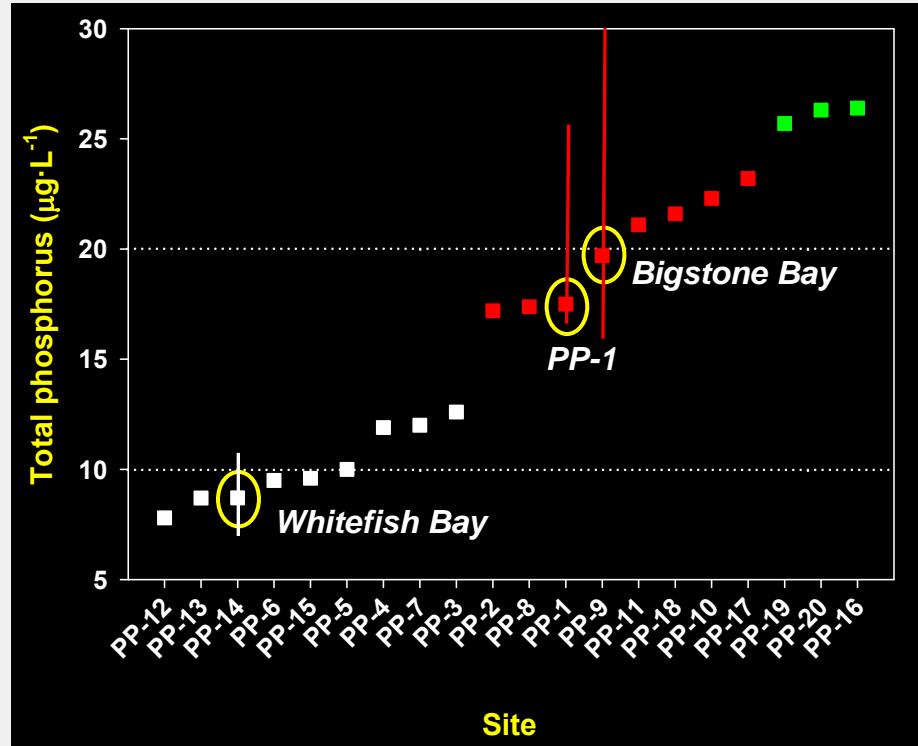

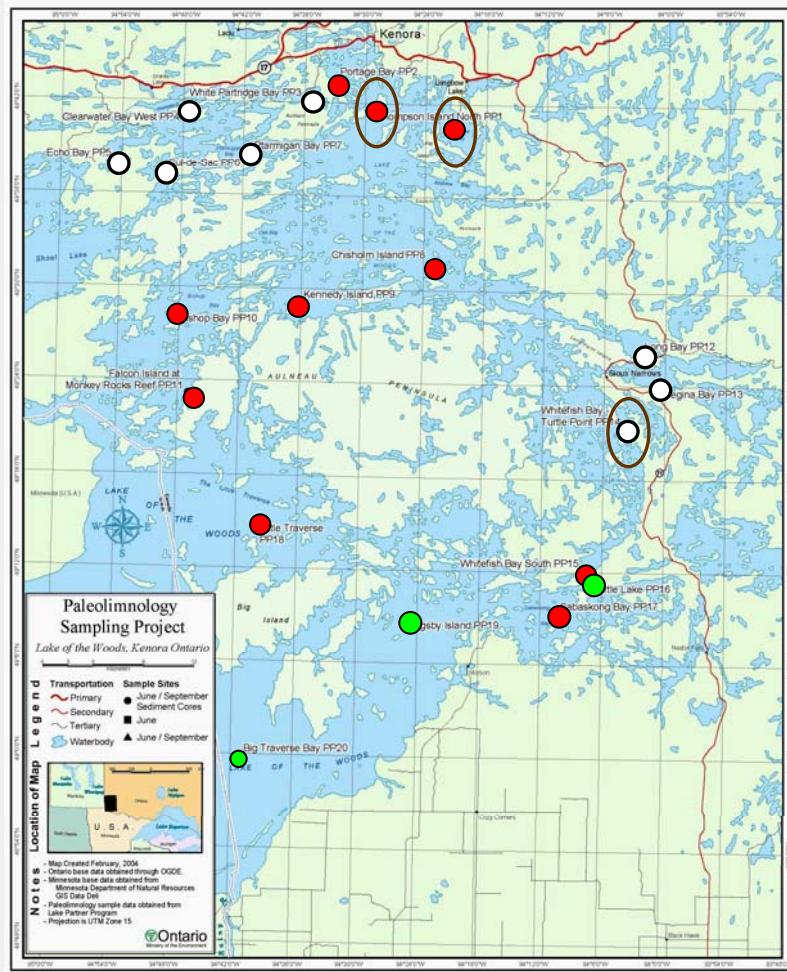

- **Explore possibility of link between recent algal blooms & TP**
 - Have TP concentrations increased in the last few decades?
- **Survey of modern sedimentary diatom assemblages in LOW (ON)**
 - Training set of LOW sites along TP gradient
 - Identify areas of elevated and low nutrient concentrations
 - Do diatoms track within-lake differences in env. conditions & water quality?
 - Development of diatom-based TP model
- **Full core analyses – historical changes in lake water quality**
 - Comparisons between reference & impact sites
 - reference = lower nutrients & no algal blooms
 - impact = elevated nutrients & algal blooms occur

Paleolimnological assessment of nutrients and algae in the LOW:

Review of initiatives

- Explore possibility of link between recent algal blooms & TP
 - Have TP concentrations increased in the last few decades?
- Survey of modern sedimentary diatom assemblages in LOW (ON)
 - Training set of LOW sites along TP gradient
 - Identify areas of elevated and low nutrient concentrations
 - Do diatoms track within-lake differences in env. conditions & water quality?
 - Development of diatom-based TP model
- Full core analyses – historical changes in lake water quality
 - Comparisons between reference & impact sites
 - reference = lower nutrients & no algal blooms
 - impact = elevated nutrients & algal blooms occur
 - Have nutrient levels changed over the past ca. 200 years?
 - Explore alternative mechanisms for recent changes

Summary & Conclusions

- Historically, TP has been relatively high and variable at all 3 sites
 - no evidence for recent increases in TP concentrations

Summary & Conclusions

- Historically, TP has been relatively high and variable at all 3 sites
 - no evidence for recent increases in TP concentrations
- **Temperature & Ice-out trends linked to diatom changes – esp. last ~20-30 yrs**
 - all sites show important relationships to warming
 - as expected this is most clearly expressed in the reference site

Summary & Conclusions

- Historically, TP has been relatively high and variable at all 3 sites
 - no evidence for recent increases in TP concentrations
- Temperature & Ice-out trends linked to diatom changes – esp. last ~20-30 yrs
 - all sites show important relationships to warming
 - as expected this is most clearly expressed in the reference site
- **Increase in 1⁰ production (Chl a) at impact sites (no trend at reference site)**
 - strong correlations to recent warming
 - likely tracking algal blooms
 - synergistic effects between nutrients & warming may be triggering algal blooms

Summary & Conclusions

- Historically, TP has been relatively high and variable at all 3 sites
 - no evidence for recent increases in TP concentrations
- Temperature & Ice-out trends linked to diatom changes – esp. last ~20-30 yrs
 - all sites show important relationships to warming
 - as expected this is most clearly expressed in the reference site
- Increase in 1° production (Chl a) at impact sites (no trend at reference site)
 - strong correlations to recent warming
 - likely tracking algal blooms
 - synergistic effects between nutrients & warming may be triggering algal blooms
- **Recent diatom shifts in LOW best explained by recent warming & associated limnological changes**
