

## Ruby the Red Blood Cell

needs your help navigating the circulatory system! Can you figure out this maze to help her get to the brain?

Blood travels from our body to the heart, where it gets pumped to the lungs. At the lungs, blood picks up oxygen before going back to the heart to get pumped out to the whole body. Our blood vessels are like a big maze that blood cells travel through every day!

1. Right Atrium
2. Right Ventricle
3. Lungs
4. Right Atrium
5. Right Ventricle
